

Install Laravel (Ubuntu)

1. Install prerequisites

Laravel needs PHP, extensions, Composer, and a web server.

</> Bash

```
sudo apt update
```

```
sudo apt install php php-cli php-mbstring php-xml php-bcmath php-curl php-
```

⌕ Bash

o php-cli php-mbstring php-xml php-bcmath php-curl php-mysql unzip curl -y

2. Install Composer

Composer is required to manage Laravel dependencies.

</> Bash

```
cd ~  
curl -sS https://getcomposer.org/installer | php  
sudo mv composer.phar /usr/local/bin/composer
```

Verify:

</> Bash

```
composer --version
```

3. Create a Laravel project

Using Composer:

❏ Bash

```
composer create-project laravel/laravel myapp
```

Or using Laravel installer:

❏ Bash

```
composer global require laravel/installer  
laravel new myapp
```

4. Set permissions

❏ Bash

```
cd myapp
```

```
sudo chmod -R 775 storage bootstrap/cache
```

5. Run Laravel server

❏ Bash

```
php artisan serve
```

Open browser:

http://127.0.0.1:8000

You should see the Laravel welcome page 🎉

6. Configure database (optional)

Edit `.env` file:

⌕ Bash

```
DB_DATABASE=your_db
DB_USERNAME=your_user
DB_PASSWORD=your_password
```

Then run:

```
❏ Bash
```

```
php artisan migrate
```

Optional (Apache setup)

If using Apache HTTP Server:

- Point DocumentRoot to:

```
/var/www/html/myapp/public
```

- Enable rewrite:

- Enable rewrite:

⌘ Bash

```
sudo a2enmod rewrite  
sudo systemctl restart apache2
```

 **Done!**

You now have:

- PHP ✓
- Composer ✓
- Laravel ✓

Tips

- Laravel version:

⌞ Bash

```
php artisan --version
```

- Clear cache:

⌞ Bash

```
php artisan cache:clear
```
